HOW TO TRANSFER THE DOOR HINGE LOCATION OF A REVERSIBLE DOOR

Refer to the disassembly diagram and change the door hinges in the following procedure.

1. Tilt the refrigerator back or lay it on its back. Use a pad or blanket to protect the floor and to avoid scratching the painted finish.
2. Remove the leveling legs by turning them counterclockwise. Remove the lower hexagonal head screws, two on the hinge side and one near the front corner of the other side.
3. Pull the door away from the top table assembly and set the door aside.
4. With a Philips plus screw driver, unscrew the shaft hinge top and transfer to the opposite side.
5. Insert the door back to the shaft hinge top which was screwed unto the opposite side.
6. Remove the refrigerator door hinge stopper and the hinge stopper screws and install them on the other side of the door.
7. Screw the bottom hinge in place ensuring the door is properly secured.
8. Screw the remaining leg to the other side.

9. The direction in which the door opens has now been changed; however, the following points should be checked:
   a. Make sure the door is on straight.
   b. Make sure that there is no space between the door gasket and the refrigerator unit itself when the door is closed.
   c. Make sure that the gasket on the hinge side is not caught between the door and the unit when the door is opened or closed. (If the door is forced closed when the gasket is caught, the gasket may be damaged.)

When checking the above points, if it is discovered that the door is not installed properly (this is apt to happen at the first try), loosen the screws holding the upper hinge, straighten the door and tighten the screws slowly with the socket wrench. After making sure that the door is installed correctly, tighten all the screws holding the hinge.

If they are not tightened, the door may slip out of position or there may be an opening between the door and the unit.
Use and Care Information

Tips on everyday care and use

1. To control the temperature:
   First, set the cold control on "3". Wait 24 hours for the entire cabinet to cool. Then adjust the control if necessary. Setting the cold control to min. is the warmest setting; maximum is the coldest. The Max setting may reduce the temperature to below freezing, but it will not cool the refrigerator faster.
2. Defrost:
   As long as the Temperature Control is set at normal position, evaporator is automatically defrosted and no manual operation is needed to defrost.
3. For all cleaning:
   Mix 2 tablespoons baking soda with 1 quart warm water or use a mild soap. Do not use strong cleaners, scouring powder or pads. For persistent odors, contact Sears Service Center for odor removal products. Do not put the drip tray in the dishwasher.
4. Cleaning the evaporation tray:
   Since the dust accumulated on the evaporation tray will decrease the evaporation efficiency, remove the tray to clean. The evaporation tray is set on the back of the refrigerator. This can be removed by pulling it out from the back of the unit.

Energy Saving tips

1. Close the door as soon as you can after opening it to remove the food. Make sure that the door is fully shut after each use so that cold air doesn't escape from the refrigerator cavity.
2. Adjust the Cold Control. Try a warmer setting. Your refrigerator may be colder than necessary. Use the condition of the milk to check the refrigerator temperature. As long as milk keeps without spoiling your refrigerator is cold enough.
3. Do not place hot foods in the refrigerator.
4. Reduce the number and length of time you open the door. Your cooling system won't have to run as often.
5. Keep your refrigerator level, so that the door seals tightly. When the door is closed, the door gaskets should touch the refrigerator all the way around.
6. If not, make the refrigerator level by use of the adjustable leg located under the unit.
7. Keep the refrigerator away from stoves or other heat sources. A cool and dry place allows your refrigerator to operate more efficiently.
